(FOR IMMEDIATE RELEASE)

R&D LifeSciences Launches First Commercially Available Liquid Egg Globulin Protein

February 2010, Menomonie, WI – R&D LifeSciences, LLC, announced today that they have developed **Protemace™ Egg Globulin Protein** – the first commercially available, patent-pending stabilized liquid egg globulin formulation that can be administered via water medicators.

According to David Zehendner, President of R&D LifeSciences, LLC, this new technology will allow water treatment options of their popular (and extensive) egg globulin proteins to manage a wide variety of production issues, especially in poultry and swine where water medicators are the preferred method of administration.

Protemace™ Custom Egg Protein products offer a highly tested and successful ***all-natural, non-drug alternative***. Protemace is a full line of pasteurized spray dried whole egg protein supplements. Extensive data suggest enhanced overall health status, higher daily gains and higher feed conversions when implementing high quality proteins in the diets. Protemace™ is classified as GRAS (Generally Recognized As Safe) for animal feeds.

“Eggs are inherently rich in antibodies, proteins and other key nutritional components,” Zehendner explains. “R&D LifeSciences takes full advantage of this perfect delivery system in its production of egg globulin protein supplements. Protemace™ products consist of pasteurized egg proteins that are specially produced and processed by an advanced, proprietary process. The major benefit to the industry is that ***the process is totally natural.***”

Protemace™ is available in convenient liquid formulations (1-gallons, 15-gallons and 55-gallons) and powder formulations 2-lb. (0.9 kg) pouch and 50-lb. (22.72 kg) bag.

For more information, pricing and the location of an R&D LifeSciences dealer near you call 1-877-874-0125, 715-231-2150 or visit www.RDLifeSciences.com.
